

CHP Partner Greenhouse Gas Reduction Report

Presented to
Energy Industries

on January 3, 2007

By the United States Environmental Protection Agency Combined Heat and Power Partnership
in recognition of the emission reductions of Energy Industries's CHP Project(s).

Through 2006, the high efficiency of Energy Industries's 5 CHP project(s) produced an estimated
0.0008 million metric tons of carbon equivalents* less than typical separate heat and power,
resulting in annual emissions reductions equivalent to:

Planting 243 acres of forest

or

Removing the emissions of 162 automobiles

*The CHP Partner Greenhouse Gas Reduction Report is an estimate of the overall carbon emission savings of your operational projects based on typical model CHP plant efficiencies and is intended for outreach and educational purposes only.
